

① what is graph?

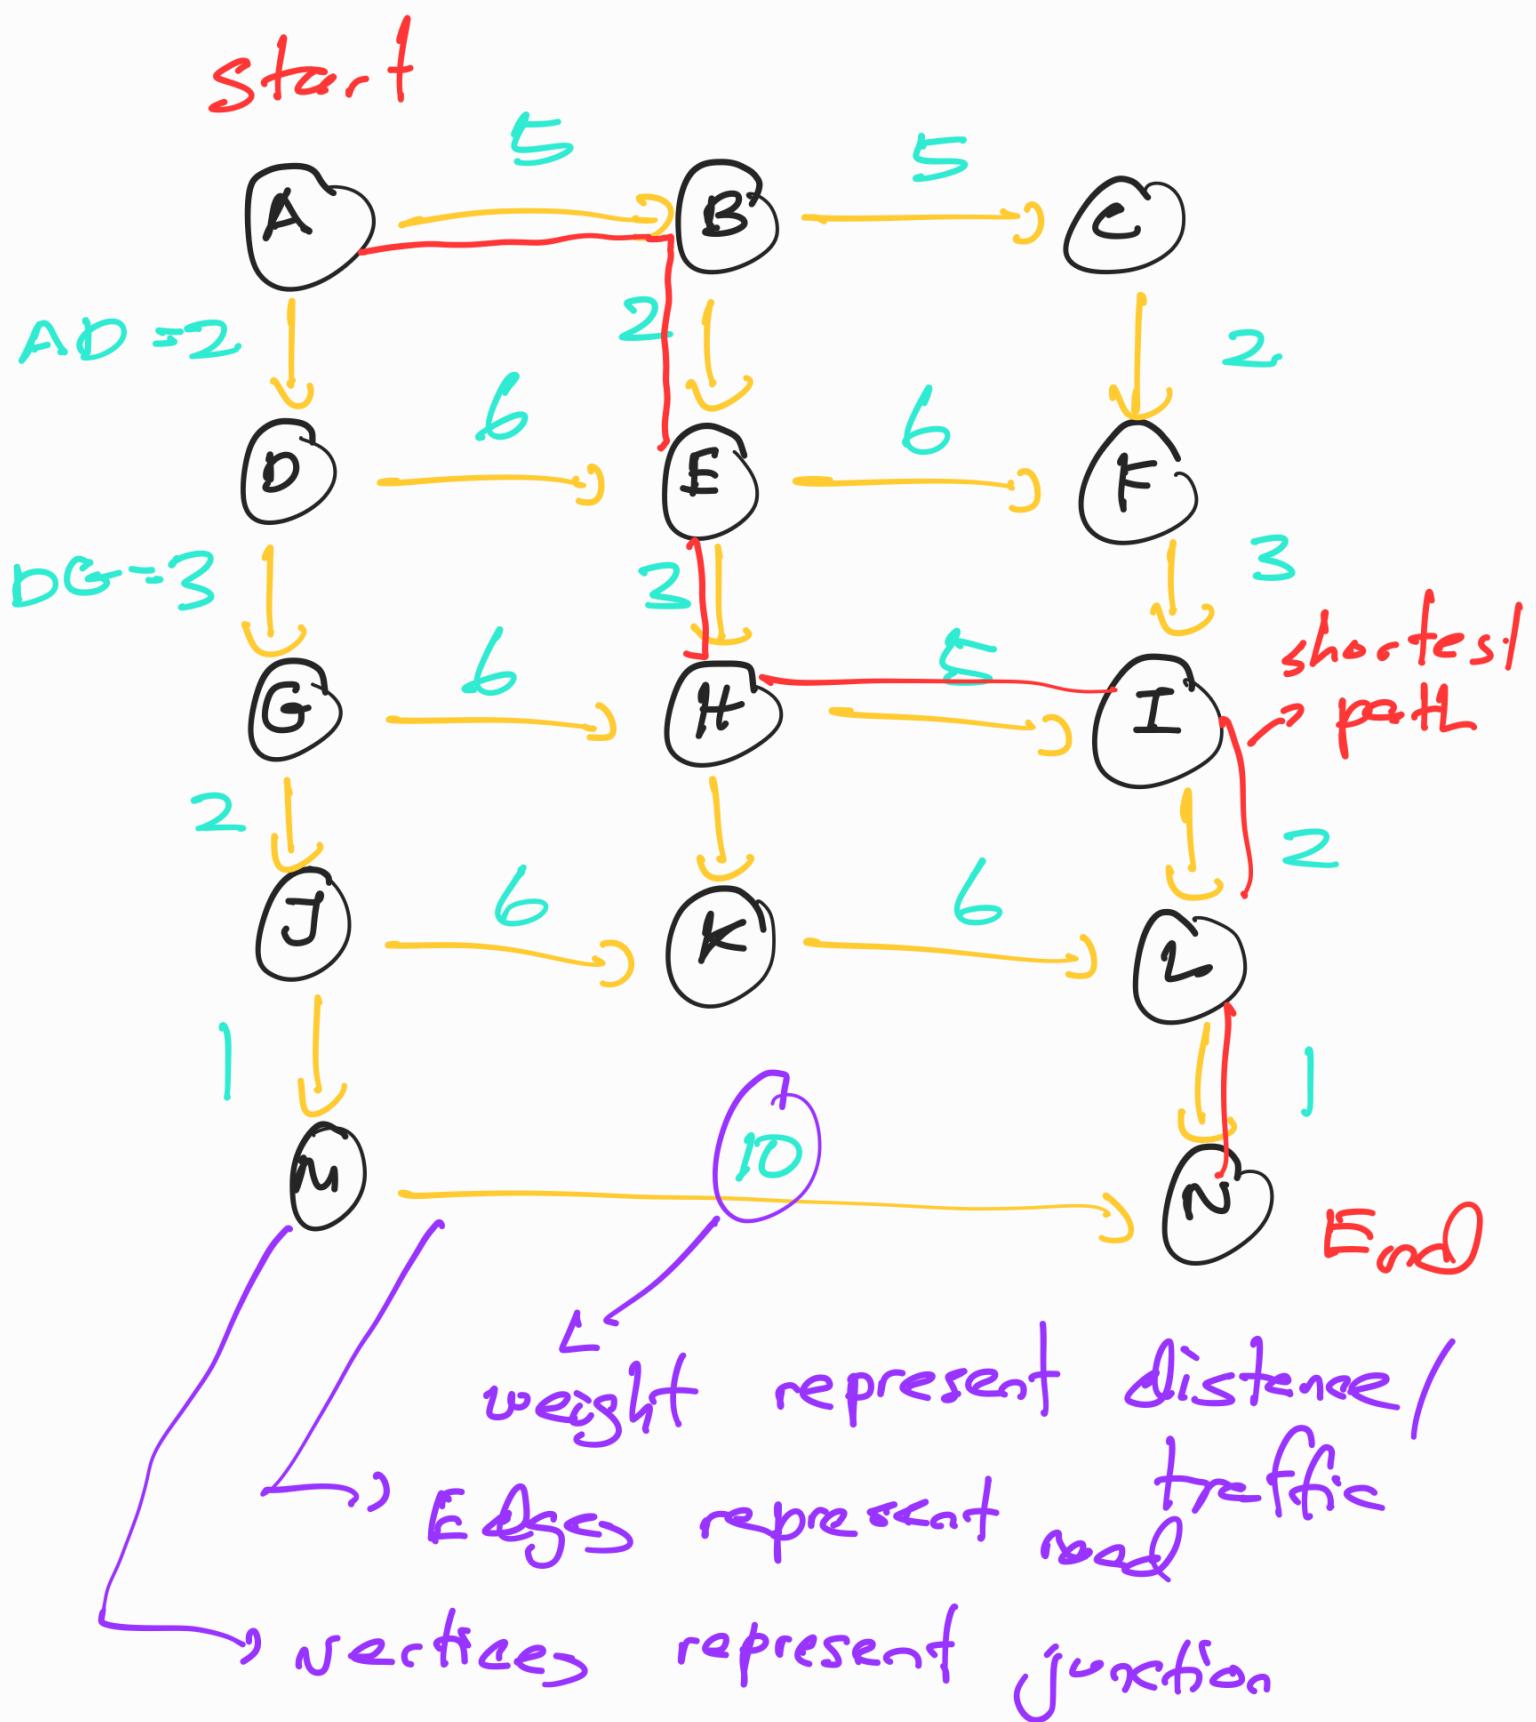

our graph  $\rightarrow$  graph theory.

## ② Graph in real applications?

Google Maps < path finding?  
fastest route?

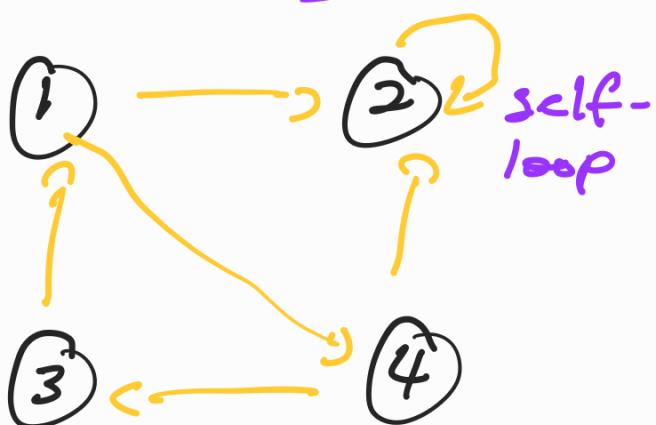

## other applications?

- scheduling
  - Job scheduling
  - Timetable
- sorting — web crawler
- computer network
- optimization
- etc. etc.

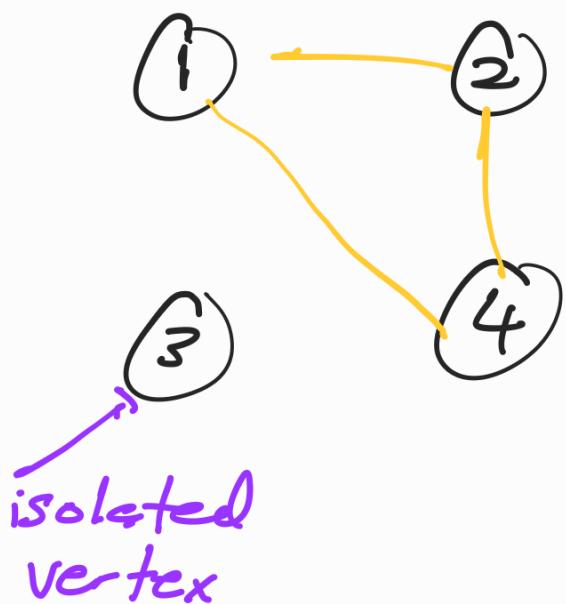

### ③ Type of Graph ?

- directed vs. undirected
- completed vs. incomplete
- weighted vs. non-weighted
- self-loop

#### Directed

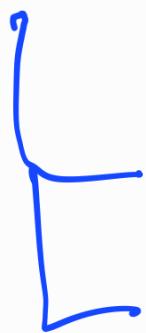

#### undirected

④ Adjacent matrix } refer to

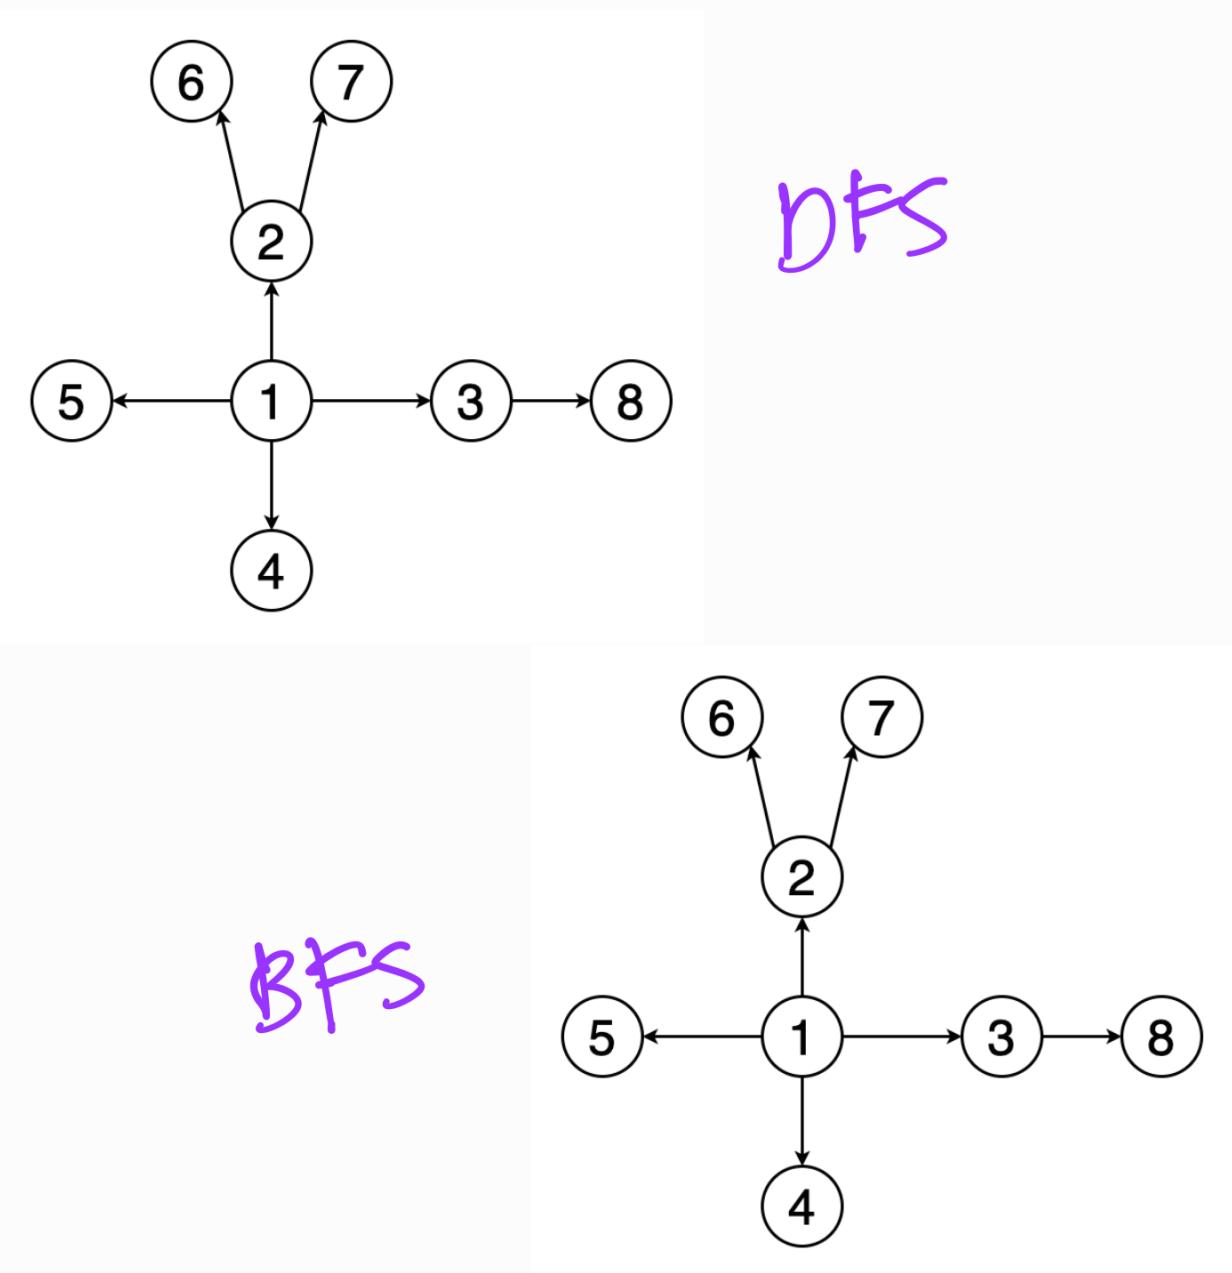

⑤ Adjacent List } sides

sorted topology

# — DFS & BFS

According to [Introduction to Algorithms](#), given a **directed acyclic graph (DAG)**, a topological sort is a linear ordering of all vertices such that for any edge  $(u, v)$ ,  $u$  comes before  $v$ . Another way to describe it is that when you put all vertices horizontally on a line, all of the edges are pointing from left to right.
